who

first introduced the idea of coordinate systems

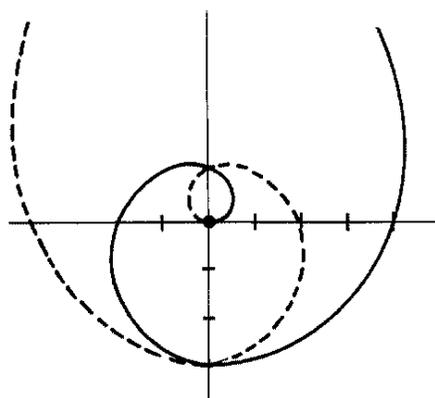

introduce polar coordinates,

Figure 4.

assign the polar coordinates (r, θ) , where r is the distance from the origin O to P , and θ is the angle between the horizontal axis and the line from O to P . in radians

Now suppose that f is a function.

Then by the **graph of f in polar coordinates** we mean the collection of all points P with polar coordinates (r, θ) satisfying $r = f(\theta)$.

Spiral of Archimedes

FIGURE 4

The graph of the equation $r = \theta$ is shown in Figure 4. The solid line correspond to all values of $\theta \geq 0$, while the dashed line corresponds to values of $\theta \leq 0$.
